A faster path to an open future

Springer Nature Group

By: Steven Inchcoombe, Wed May 8 2019

At Springer Nature we want to find the fastest and most effective route to immediate open access (OA) for all primary research. This blog describes a potential significant way to progress it and we are asking other interested stakeholders to read, consider and comment on this [LinkedIn post](#) so all can see if this would receive widespread support.

Author: Steven Inchcoombe
Chief Publishing Officer at Springer Nature

In February, along with many others, we responded to the consultation request from cOAlition S on its implementation guidance. In our [submission](#), we expressed continued strong support for hybrid journals, given they currently publish most of the world's research and their proven ability to enable growth in OA take-up, particularly as part of transformative read and publish deals where we have seen [73-90% success rates](#). In light of the evidence we presented, we asked Plan S to think again. Similarly, we explained why Plan S's proposed zero embargo green OA, immediately utilising a CC BY license, would

Mandating a data availability statement

Many journals, including Nature and BMC, require all authors to tell readers how they can get hold of their data.

Data availability statement:

- The datasets generated during and/or analysed during the current study are available in the [NAME] repository, [PERSISTENT WEB LINK TO DATASETS].
- The datasets generated during and/or analysed during the current study are available from the corresponding author on reasonable request.
- All data generated or analysed during this study are included in this published article (and its supplementary information files).

ANNOUNCEMENT

Where are the data?

As the research community embraces data sharing, academic journals can do their bit to help. Starting this month, all research papers accepted for publication in *Nature* and an initial 12 other Nature titles will be required to include information on whether and how others can access the underlying data.

These statements will report the availability of the 'minimal data set' necessary to interpret, replicate and build on the findings reported in the paper. Where applicable, they will include details about publicly archived data sets that have been analysed or generated during the study. Where restrictions on access are in place — for example, in the case of privacy limitations or third-party control — authors will be expected to make this clear.

Nature **536**, 138 (20016). To learn more go to <http://go.nature.com/2bf4vqn>

Sharing code and materials is equally important

nature
research

“A condition of publication in a Nature journal is that authors are required to make unique materials promptly available to others without undue qualifications.”

<http://www.nature.com/authors/policies/availability.html>

Code share

Papers in Nature journals should make computer code accessible where possible.

A theme in *Nature's* ongoing campaign for the replicability and reproducibility of our research papers is that key components of publications should be available to peers who wish to validate the techniques and results.

A core element of many papers is the computer code used by authors in models, simulations and data analysis. In an ideal world, this code would always be transportable and easily used by others. In such a world, our editorial policy would be to insist on sharing to allow free use, as we already do (as far as is practicable) with data and research materials. Unfortunately, such an ideal is not easy to attain owing to the amount of extra funding and effort it would require to render some major pieces of code shareable. Nevertheless, we at *Nature* and the Nature research journals want to encourage as much sharing as possible.

Climate modellers have made some strides in this regard. The journal *Geoscientific Model Development* has a good example of such a policy (see go.nature.com/jv8g1w), and an article in *Nature Geoscience* discusses some of the opportunities presented by code sharing, as well as

the obstacles (S. M. Easterbrook *Nature Geosci.* 7, 779–781; 2014).

As a leading example of transparency policies in other disciplines, the data journal *GigaScience* requires code used in its papers to be available, and hosts it in a way that allows others to analyse the data in publications. One point made by Easterbrook is that even if the code is shared, others might often make little or no use of it, but on some occasions the take-up will be large.

Nature and the Nature journals have decided that, given the diversity of practices in the disciplines we cover, we cannot insist on sharing computer code in all cases. But we can go further than we have in the past, by at least indicating when code is available. Accordingly, our policy now mandates that when code is central to reaching a paper's conclusions, we require a statement describing whether that code is available and setting out any restrictions on accessibility. Editors will insist on availability where they consider it appropriate: any practical issues preventing code sharing will be evaluated by the editors, who reserve the right to decline a paper if important code is unavailable. Moreover, we will provide a dedicated section in articles in which any information on computer code can be placed. And we will work with individual communities to put together best-practice guidelines and possibly more-detailed rules.

For full details, see our guide for authors at go.nature.com/o5ykhe. For an archive of our content and initiatives concerning reproducibility, see <http://www.nature.com/nature/focus/reproducibility>. ■

Many landmark findings in preclinical oncology research are not reproducible, in part because of inadequate cell lines and animal models.

Raise standards for preclinical cancer research

C. Glenn Begley and Lee M. Ellis propose how methods, publications and incentives must change if patients are to benefit.

Efforts over the past decade to characterize the genetic alterations in human cancers have led to a better understanding of molecular drivers of this complex set of diseases. Although we in the cancer field hoped that this would lead to more effective drugs, historically, our ability to translate cancer research to clinical success has been remarkably low¹. Sadly, clinical

trials in oncology have the highest failure rate compared with other therapeutic areas. Given the high unmet need in oncology, it is understandable that barriers to clinical development may be lower than for other disease areas, and a larger number of drugs with suboptimal preclinical validation will enter oncology trials. However, this low success rate is not sustainable or acceptable, and

investigators must reassess their approach to translating discovery research into greater clinical success and impact.

Many factors are responsible for the high failure rate, notwithstanding the inherently difficult nature of this disease. Certainly, the limitations of preclinical tools such as inadequate cancer-cell-line and mouse models² make it difficult for even ▶

Life Sciences Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form is intended for publication with all accepted life science papers and provides structure for consistency and transparency in reporting. Every life science submission will use this form; some list items might not apply to an individual manuscript, but all fields must be completed for clarity.

For further information on the points included in this form, see [Reporting Life Sciences Research](#). For further information on Nature Research policies, including our [data availability policy](#), see [Authors & Referees](#) and the [Editorial Policy Checklist](#).

▶ Experimental design

1. Sample size

Describe how sample size was determined.

Describe the statistical methods that were used to predetermine sample size OR if no sample-size calculation was performed, describe how sample sizes were chosen and provide a rationale for why these sample sizes are sufficient.

2. Data exclusions

Describe any data exclusions.

If no data were excluded from the analyses, state so OR if data were excluded, describe the exclusions and the rationale behind them, indicating whether exclusion criteria were pre-established.

3. Replication

Describe whether the experimental findings were reliably reproduced.

For each experiment, note whether any attempts at replication failed OR state that all attempts at replication were successful.

Disaggregation of the research publishing process

Recognising the value of preprints

<http://www.nature.com/authors/policies/preprints.html>

“Nature Research journals **support posting of primary research manuscripts on community preprint servers** such as [arXiv](#) and [bioRxiv](#). Preprint posting is not considered prior publication and **will not jeopardize consideration** at Nature Research journals. Preprints will not be considered when determining the conceptual advance provided by a study under consideration at Nature Research.”

Editorial | [OPEN](#)

Preprints under peer review

“We are now offering authors whose submitted manuscript has been deposited in a preprint server, and is selected for peer review, the option of **including their paper on a public list of articles under review** at *Nature Communications*. The list, which will appear on our dedicated website and will be freely accessible to all without registration, will **provide a link to the preprint** on the recognized preprint server. We hope that by offering additional visibility to preprints that are under consideration in our journal, we will not only be able to **accelerate the dissemination of potentially exciting science**, but also complement our peer review process by promoting wider scrutiny of preprints and thus a more holistic review procedure.”

In Review

From Springer Nature and Research Square

See your manuscript's review progress with our first-of-its-kind In Review service

Our commitment to research in progress and openness inspires us to think about how to help our authors in new ways. So, together with our partners at Research Square, we've added a new option for you when you submit to select Springer Nature journals. This new option, called In Review, gives you insight over your manuscript's editorial progress; even while it's out for review.

How can you participate?

It's simple! Just select the [In Review](#) option when you submit your next article to one of the participating journals.

See the articles that are In Review—now including every BMC Series journal

Hundreds of articles are undergoing peer review on the In Review platform—now including almost every journal in the BMC Series!

With In Review you can:

- ✓ Track the status of your manuscript, including when reviews have been received
- ✓ Share your work with funders and others in a citeable way while it is under review, and engage the wider community in discussion to help make your article even better including through the Hypothes.is open annotation tool. And social sharing is easy—every article page has social media buttons at the top
- ✓ Demonstrate the integrity of your work with a transparent editorial checklist
- ✓ Benefit from early sharing, such as more collaboration opportunities and earlier citations.

Your peers will be able to:

- ✓ Comment on/see emerging science in full HTML format
- ✓ Find new discoveries with fully-indexed search
- ✓ Note which editorial checks the manuscript has already passed
- ✓ Gain insight into the peer review pipeline of particular manuscripts at the given journals.

Exogenous testosterone increases sensitivity to moral norms in moral dilemma judgements

Skylar M. Brannon, Sarah Carr, Ellie Shuo Jin, Robert A. Josephs & Bertram Gawronski

Nature Human Behaviour **3**, 856–866 (2019) | [Download Citation](#)

860 Accesses | **2** Citations | **348** Altmetric | [Metrics](#)

Abstract

Moral dilemma judgements frequently involve decisions where moral norms and the greater good are in conflict. The current preregistered study tested the effect of the steroid hormone testosterone on moral dilemma judgements using a double-blind administration of testosterone or placebo. Counter to predictions, testosterone administration led to increased inaction in moral dilemmas where harmful actions prohibited by moral norms increase overall well-being. Using a mathematical model to disentangle sensitivity to consequences, sensitivity to moral norms and general preference for inaction versus action, analyses further revealed that testosterone administration influenced judgements by increasing sensitivity to moral norms. Exploratory analyses suggested the opposite pattern for endogenous testosterone measured at baseline, in that higher levels of endogenous testosterone were associated with lower sensitivity to moral norms. The results indicate that the role of testosterone in moral judgements is more complex than suggested by previous findings.

Protocol registration

The stage 1 protocol for this Registered Report was accepted in principle on 13 November 2017. The protocol, as accepted by the journal, can be found at <https://osf.io/rysbe/>¹.

Case studies

Learning about urban climate solutions from case studies

William F. Lamb ^{1,2*}, Felix Creutzig ^{1,3}, Max W. Callaghan ^{1,2} and Jan C. Minx ^{1,2}

Climate mitigation research puts increasing emphasis on cities, but much more could be learned from urban case studies. The overall size, geographic scope and topic content of cases remains unknown, resulting in few attempts to synthesise the bottom-up evidence. Here, we use scientometric and machine-learning methods to produce a comprehensive map of the literature. Our database of approximately 4,000 case studies provides a wealth of evidence to search, compare and review. We find that cities in world regions with the highest future mitigation relevance are systematically underrepresented. A map of the evidence allows case studies to be matched with urban typologies in new and more ambitious forms of synthesis, bringing together traditionally separate strands of qualitative and quantitative urban research.

City-scale reforms in transportation, building design and urban form have substantial potential for reducing energy demand and achieving sustainability co-benefits. But when it comes to learning about appropriate policies, the key questions are: what works, for whom, under what conditions, and why? With no consistent epistemology, enormous variety in boundaries of analysis and a lack of formal research synthesis, urban mitigation solutions remain diffuse and poorly understood^{1–3}.

Systematic learning hinges on aggregating information about individual cities. Recent work emphasises a quantitative direction to this work, using ‘big data’ and typologies to identify structural similarities and paths for development. In this case,

Overall we identify a large and varied case literature, albeit one with regional and topic biases. To bring the policy relevance of cases to the forefront, we discuss the different opportunities they present for learning. We argue for more ambition in comparative studies, the need for systematic reviews of cases, and the potential to organise case study insights using quantitative typologies of cities.

As a starting point to our analysis, we obtain a sample of urban mitigation articles using a search query that combines synonyms for ‘urban’ and ‘mitigation’ in the Web of Science and Scopus literature databases (see Methods). Our interpretation of case study research is straightforward: if an article mentions a city name in the abstract or title, we assume it is a case study located in the city (positive)

Expert elicitations

Climate as a risk factor for armed conflict

Katharine J. Mach^{1*}, Caroline M. Kraan², W. Neil Adger³, Halvard Buhaug^{4,5}, Marshall Burke^{1,6}, James D. Fearon⁷, Christopher B. Field², Cullen S. Hendrix^{8,9}, Jean-Francois Maystadt^{10,11}, John O'Loughlin¹², Philip Roessler¹³, Jürgen Scheffran¹⁴, Kenneth A. Schultz⁷ & Nina von Uexkull^{4,15}

Research findings on the relationship between climate and conflict are diverse and contested. Here we assess the current understanding of the relationship between climate and conflict, based on the structured judgments of experts from diverse disciplines. These experts agree that climate has affected organized armed conflict within countries. However, other drivers, such as low socioeconomic development and low capabilities of the state, are judged to be substantially more influential, and the mechanisms of climate–conflict linkages remain a key uncertainty. Intensifying climate change is estimated to increase future risks of conflict.

Research over the past decade has established that climate variability and climate change may influence the risk of violent conflict, including organized armed conflict^{1,2}. However, use of different research designs, datasets and methods has resulted in divergent findings and stark questions about legitimate approaches to scientific inference^{1,3–9}. Previous analyses, many from authors of this paper, have both asserted and refuted a substantial role for climate in conflicts to date and have repeatedly triggered dissenting perspectives^{1,3–6,9–22}. Even syntheses have failed to clarify areas of agreement and reasons for disagreement^{2,4,5,8,9,12,13,23–26}. There are important uncertainties about when and how climate has caused conflict to date, and under future scenarios^{8,23,27,28}. The lack of clarity on current knowledge limits informed management of the risks of conflict to states and human security, and of the risks of continuing greenhouse gas emissions.

the effects of climate, climate-related variability, hazards, trends and change are all included (for example, related to temperature, precipitation, modes of variability, such as the El Niño Southern Oscillation, and extreme events, such as droughts and floods).

The authors of this manuscript consist of 3 assessment facilitators and a group of 11 climate and conflict experts. The group of 11 experts is a sample of the most experienced and highly cited scholars on the topic, spanning relevant social science disciplines (especially political science, economics, geography and environmental sciences), epistemological approaches and diverse previous conclusions about climate and conflict (Methods). The selection of the expert group was done based on expertise necessary to resolve scientific disagreement about the contribution of climate to conflict risks globally and in conflict-prone regions, which requires consideration of comparative and crosscutting

Springer Nature publishes its first machine-generated book

Innovative book prototype provides a compelling machine-generated overview about the latest research on lithium-ion batteries, automatically compiled by an algorithm developed in collaboration with the Applied Computational Linguistics lab of Goethe University Frankfurt/Main (Germany)

London | Heidelberg, 02 April 2019

Springer Nature published its first machine-generated book in chemistry. The book prototype provides an overview of the latest research in the rapidly growing field of lithium-ion batteries. The content is a cross-corpus auto-summation of a large number of current research articles in this discipline. Serving as a structured excerpt from a huge set of papers, the innovative pipeline architecture aims at helping researchers to manage the information overload in this discipline efficiently.

In close collaboration between Springer Nature and researchers from Goethe University Frankfurt/Main, a state-of-the-art algorithm, the so-called *Beta Writer*, was developed to select, consume and process relevant publications in this field from Springer Nature's content platform *SpringerLink*. Based on this peer-reviewed and published content, the Beta Writer uses a similarity-based clustering routine to arrange the source documents into coherent chapters and sections. It then creates succinct summaries of the articles. The extracted quotes are referenced by hyperlinks which allow readers to further explore the original source documents. Automatically created introductions, table of contents and references facilitate the orientation within the book.

Niels Peter Thomas, Managing Director Books at Springer Nature, said: "Looking back to a long tradition and expertise in academic book publishing, Springer Nature is aiming at shaping the future of book publishing and reading. New technologies around Natural Language Processing and Artificial Intelligence offer promising opportunities for us to explore the generation of scientific content with the help of algorithms. As a global publisher, it is our responsibility to take potential implications and limitations of machine-generated content into consideration, and to provide a reasonable framework for this new type of content for the future."

Henning Schoenenberger, Director Product Data & Metadata Management at Springer Nature, added: "We are thrilled to finally publish this new type of research content and make it available for the global research community. While research articles and books written by researchers and authors will continue to play a crucial role in scientific publishing, we foresee many different content types in academic publishing in the future: from yet entirely human-created content creation to a variety of blended man-machine text generation to entirely machine-generated text. This prototype is a first important milestone we reached, and it will hopefully also initiate a public debate on the opportunities, implications, challenges and potential risks of machine-generated content in scholarly publishing."
